

V0.4.0 RELEASE

synlynk
synaptic link for ai dev

The OS for Multi-Agent Dev

QUICK START GUIDE

synlynk is a minimalist, zero-dependency local orchestrator running beneath your AI CLIs. It coordinates agent slots, maintains a cryptographically-attributed project memory, manages asynchronous background dispatches, and enforces safety boundaries.

01.1 Core Philosophy

AI agents are currently treated as isolated command-line tools. synlynk introduces an operating-system layer directly under them, enabling a stable, shared local substrate.

- **Context Swapping**

Injects a compiled project state snapshot (.synlynk/context.md) into agent shells before invocation.

- **Cryptographic Trace**

Tracks and signs every decision in project-docs/memory.md using machine-level Ed25519 keypairs.

01.2 3-Minute Global Bootstrap

To install synlynk globally, execute the zero-dependency install script. It sets up a standalone link in your shell profile.

STEP 1: GLOBAL INSTALLATION

```
# Pull and run the installer (zero pip dependencies)
curl -fsSL https://synlynk.com/install.sh | bash

# Verify installation
synlynk --version    # Output: synlynk 0.4.0
```

STEP 2: INTERACTIVE REPO INITIALIZATION

```
# Move to your workspace and initialize
synlynk init
```

🌟 **Magic Moment 1: Autodiscovery**

The `init` wizard performs a semantic scan of your git tree, auto-discovers functional agent CLIs (Claude, Gemini, Codex), bootstraps your `project-docs/` ledger, and offers opt-in LLM roadmap synthesis.

02.1 Multi-Agent Background Dispatch

synlynk allows background dispatching of tasks to agents. Commands run detached in a separate session, preventing shell lock.

BACKGROUND OPERATIONS EXAMPLE

```
# Dispatch an agent to implement a feature in the background
synlynk dispatch claude --task "implement jwt token authentication"

# View status of running and completed jobs
synlynk jobs --all

# Tail logs for a specific job
synlynk logs --job job-d71a8bc --tail 100
```

02.2 Command Set

<code>synlynk status</code>	Displays current project health status, active budgets (cost vs limit), and outstanding Sentinel alarms.
<code>synlynk run --trio</code>	🌟 Magic Moment 2: Dispatches all three functional agents (Claude, Gemini, Codex) in parallel to work on a task.
<code>synlynk shell</code>	Spawns an interactive shell with context environment variables ('SYNLINK_CONTEXT', 'SYNLINK_PROJECT_DIR') pre-loaded.
<code>synlynk launch <agent></code>	Copies 'context.md' to 'context-<agent>.md' and launches the agent CLI interactively in the current directory.
